

## JBMO Shortlist 2013

### – Algebra

---

1 A1 Find all ordered triplets of  $(x, y, z)$  real numbers that satisfy the following system of equation  $x^3 = \frac{z}{y} - \frac{2y}{z}$   $y^3 = \frac{x}{z} - \frac{2z}{x}$   $z^3 = \frac{y}{x} - \frac{2x}{y}$

---

2 A2 Find the maximum value of  $|\sqrt{x^2 + 4x + 8} - \sqrt{x^2 + 8x + 17}|$  where  $x$  is a real number.

---

3 Show that

$$\left(a + 2b + \frac{2}{a+1}\right) \left(b + 2a + \frac{2}{b+1}\right) \geq 16$$

for all positive real numbers  $a$  and  $b$  such that  $ab \geq 1$ .

---

### – Combinatorics

---

1 Find the maximum number of different integers that can be selected from the set  $\{1, 2, \dots, 2013\}$  so that no two exist that their difference equals to 17.

---

2 In a billiard with shape of a rectangle  $ABCD$  with  $AB = 2013$  and  $AD = 1000$ , a ball is launched along the line of the bisector of  $\angle BAD$ . Supposing that the ball is reflected on the sides with the same angle at the impact point as the angle shot, examine if it shall ever reach at vertex B.

---

3 Let  $n$  be a positive integer. Two players, Alice and Bob, are playing the following game:  
- Alice chooses  $n$  real numbers; not necessarily distinct.  
- Alice writes all pairwise sums on a sheet of paper and gives it to Bob. (There are  $\frac{n(n-1)}{2}$  such sums; not necessarily distinct.)  
- Bob wins if he finds correctly the initial  $n$  numbers chosen by Alice with only one guess.  
Can Bob be sure to win for the following cases?

- a.  $n = 5$
- b.  $n = 6$
- c.  $n = 8$

Justify your answer(s).

[For example, when  $n = 4$ , Alice may choose the numbers 1, 5, 7, 9, which have the same pairwise sums as the numbers 2, 4, 6, 10, and hence Bob cannot be sure to win.]

---

– Geometry

---

- 1** Let  $AB$  be a diameter of a circle  $\omega$  and center  $O$ ,  $OC$  a radius of  $\omega$  perpendicular to  $AB$ ,  $M$  be a point of the segment  $(OC)$ . Let  $N$  be the second intersection point of line  $AM$  with  $\omega$  and  $P$  the intersection point of the tangents of  $\omega$  at points  $N$  and  $B$ . Prove that points  $M, O, P, N$  are cocyclic.

(Albania)

---

- 2** Circles  $\omega_1, \omega_2$  are externally tangent at point  $M$  and tangent internally with circle  $\omega_3$  at points  $K$  and  $L$  respectively. Let  $A$  and  $B$  be the points that their common tangent at point  $M$  of circles  $\omega_1$  and  $\omega_2$  intersect with circle  $\omega_3$ . Prove that if  $\angle KAB = \angle LAB$  then the segment  $AB$  is diameter of circle  $\omega_3$ .

Theoklitos Paragiou (Cyprus)

---

- 3** Let  $ABC$  be an acute-angled triangle with  $AB < AC$  and let  $O$  be the centre of its circumcircle  $\omega$ . Let  $D$  be a point on the line segment  $BC$  such that  $\angle BAD = \angle CAO$ . Let  $E$  be the second point of intersection of  $\omega$  and the line  $AD$ . If  $M, N$  and  $P$  are the midpoints of the line segments  $BE, OD$  and  $AC$ , respectively, show that the points  $M, N$  and  $P$  are collinear.

- 4** Let  $I$  be the incenter and  $AB$  the shortest side of the triangle  $ABC$ . The circle centered at  $I$  passing through  $C$  intersects the ray  $AB$  in  $P$  and the ray  $BA$  in  $Q$ . Let  $D$  be the point of tangency of the  $A$ -excircle of the triangle  $ABC$  with the side  $BC$ . Let  $E$  be the reflection of  $C$  with respect to the point  $D$ . Prove that  $PE \perp CQ$ .

- 5** A circle passing through the midpoint  $M$  of the side  $BC$  and the vertex  $A$  of the triangle  $ABC$  intersects the segments  $AB$  and  $AC$  for the second time in the points  $P$  and  $Q$ , respectively. Prove that if  $\angle BAC = 60^\circ$ , then  $AP + AQ + PQ < AB + AC + \frac{1}{2}BC$ .

- 6** Let  $P$  and  $Q$  be the midpoints of the sides  $BC$  and  $CD$ , respectively in a rectangle  $ABCD$ . Let  $K$  and  $M$  be the intersections of the line  $PD$  with the lines  $QB$  and  $QA$ , respectively, and let  $N$  be the intersection of the lines  $PA$  and  $QB$ . Let  $X, Y$  and  $Z$  be the midpoints of the segments  $AN, KN$  and  $AM$ , respectively. Let  $l_1$  be the line passing through  $X$  and perpendicular to  $MK$ ,  $l_2$  be the line passing through  $Y$  and perpendicular to  $AM$  and  $l_3$  the line passing through  $Z$  and perpendicular to  $KN$ . Prove that the lines  $l_1, l_2$  and  $l_3$  are concurrent.
-

– Number Theory

---

**1**  $N1$  find all positive integers  $n$  for which  $1^3 + 2^3 + \dots + 16^3 + 17^n$  is a perfect square.

---

**2** Solve in integers  $20^x + 13^y = 2013^z$ .

---

**3** Find all ordered pairs  $(a, b)$  of positive integers for which the numbers  $\frac{a^3b-1}{a+1}$  and  $\frac{b^3a+1}{b-1}$  are both positive integers.

---

**4** A rectangle in  $xy$  Cartesian System is called latticed if all its vertices have integer coordinates.  
a) Find a latticed rectangle of area 2013, whose sides are not parallel to the axes.  
b) Show that if a latticed rectangle has area 2011, then their sides are parallel to the axes.

---

**5** Solve in positive integers:  $\frac{1}{x^2} + \frac{y}{xz} + \frac{1}{z^2} = \frac{1}{2013}$ .

---

**6** Solve in integers the system of equations:

$$x^2 - y^2 = z$$

$$3xy + (x - y)z = z^2$$

---
